Project Design

Project Title

Implement Client Script & UI Policy (Incident)

1. Introduction

The Project Design phase defines how the requirements identified in Phase 2 will be implemented in ServiceNow. The design uses a combination of UI Policy, UI Policy Actions, and Client Scripts to control Incident form behavior.

The main condition used in the design is Impact = High.

2. System Design

The project is designed around the following flow:

Incident Record

Check Impact

Impact = High?

Apply UI Policy / Client Script Rules

Control Urgency and Assigned To

Validate Before Save

Incident Record Saved

3. UI Policy Design

UI Policy Name

High Impact Control

Table

Incident

Condition

Field	Operator	Value
Impact	is	1 – High

The UI Policy is active and uses Reverse if false so that the applicable field behavior is reversed when the condition is no longer satisfied.

4. UI Policy Action Design

The UI Policy Action is designed for the Urgency field.

Field	Configuration
Field Name	Urgency
Read-only	True
Visible	Unchanged

Therefore, when Impact is High, the Urgency field becomes read-only while remaining visible.

5. Client Script Design

Three types of Client Scripts are designed in the project.

5.1 onChange Client Script

Name: Auto set urgency for high impact

Table: Incident

Type: onChange

Field: Impact

Purpose:

When Impact changes to High, the script automatically sets Urgency to High and displays an information message.

5.2 onSubmit Client Script

Name: Prevent save if Assigned To missing

Table: Incident

Type: onSubmit

Purpose:

The script checks whether Assigned To is empty when Impact is High. If it is empty, the Incident cannot be saved and an error message is displayed.

5.3 onCellEdit Client Script

Name: Prevent state change via list edit

Table: Incident

Type: onCellEdit

Field: State

Purpose:

The script prevents users from changing the State directly through list editing and displays an alert asking them to open the Incident.

6. Field Behavior Design

Condition / Action	Expected Behavior
Impact = High	High Impact UI Policy is triggered
Impact = High	Urgency becomes read-only
Impact changed to High	Urgency automatically becomes High
Impact = High + Assigned To empty	Save is prevented
State edited from list	Change is blocked
Impact changed from High to Medium	Applicable UI Policy behavior is reversed
State changed through form	Change can be saved

These behaviors correspond to the configuration and testing described in the project document.

7. Design of Validation

Before saving an Incident, the system checks the required condition:

Impact = High + Assigned To is empty

! Display Error

! Prevent Save

When Assigned To is provided, the Incident can be submitted successfully.

8. Design of List Editing Control

The State field is specifically controlled during list editing.

User edits State in list

! onCellEdit Client Script executes

! Alert displayed

! callback(false)

! State change blocked

9. Expected Design Outcome

The final design provides:

- Dynamic field behavior
- Automatic Urgency update
- Mandatory Assigned To validation
- Read-only Urgency control
- State list-edit restriction
- Proper reversal of UI Policy behavior

10. Conclusion

The Project Design phase defines the structure and behavior of the ServiceNow Incident solution. The design combines a High Impact Control UI Policy, a UI Policy Action for Urgency, and onChange, onSubmit, and onCellEdit Client Scripts to implement the required controls. This design provides the foundation for the next phase, Project Planning.
